

AnyChain Benchmark Agent - Report Preview

This preview shows the report sections users will see after a benchmark run.

Executive Summary

The report starts with run metadata, cloud provider, region, machine type, disk baseline, RPC mode, and maximum

Core Performance Charts

Performance overview explains CPU, memory, disk IOPS, throughput, and utilization trends.

CPU-disk correlation helps identify whether high CPU time is actually disk wait or queue

Disk threshold charts compare observed utilization and latency with configured IOPS and throughput baselines.

Per-Method RPC Attribution

Per-method charts show success/failure counts and P50/P90/P99 latency for workload

Sync Health

Sync-health charts show height gap, reported lag, or freshness depending on the chain

Artifact Evidence

The Agent cites HTML, CSV, runtime.env, archive summary, and optional Prometheus/
